Bogatha waterfalls

Listen to a rare symphony, limited by time.

Welcome to Telangana. A land where it pays to stop and listen to the hidden sounds of music around you. The tinkle of glass bangles in a street side shop, the delightfully haunting music of a Kinnera Veena, a rare musical instrument that very few can play today.

Or even the deafening drum roll of a waterfall over your shoulders. Birds in the trees, an old radio belting out Qawwali music in a tea shop, street hawkers rhythmic sales spiel, temple bells ringing.

The symphony is almost complete. It only waits for you to join in on the chorus.

“Being a fish out of water is tough,
but that's how you evolve.”
-Kumail Nanjiani

EDITOR'S NOTE

PERFECTION IS CONSTANT TRANSFORMATION

One of my most beloved childhood memories and mania was Pokémon. When I think of 'evolve' or 'evolution', besides all the worldly transformations, their evolution to a next, much stronger stage pop up in my mind. What started as a video game twenty years ago, developed into a world-wide phenomenon.

Pokémon was the result of bug-collecting, video game-obsessing autistic child from Japan - Satoshi Tajiri. He wanted to give children the same joy he got while collecting bugs. He noticed that with every stage up of this transformation, the creature would become more perfect, stronger and even gain new abilities. His keen observations of the insect world and their metamorphosis from an egg to an adult became the basis of the concept of evolution in Pokémon. Well that and the imagination to create these pocket monsters.

When you look at the Earth and the life on it from a historical point of view, you'll observe a similar trend. Charles Darwin observed this too. The creatures that survived, evolved traits that made them more perfect to survive - us humans too.

What do you think our next evolutionary traits would be? In this last issue of Imagine's volume 3, you will find such mind-tickling topics that cover all the realms - the space, the Earth and the digital. There's a magical experiment too along with a list of summer camps you can join. We're also giving you an awesome opportunity to intern with us and work with the Imagine team. To know more, write to us at imagine.thinkedu@gmail.com. Meanwhile, don't keep calm because summer's here!

Your friend,
Nikita Jain.

Truly in y ales

If you're one of those people who does not like reading pages and pages of stories but loves stories, then this contest is for you. Make your own proverb, quote or even little tale like these and send them to us to be printed right here!

Tried learning trigonometry
under the hot sun.

Only thing I got was a tan.

Example-1

"You can't stop time." the mother
said to the four-year-old.

Next day, none of the clocks
in the house had batteries.

Example-2

WHAT TO DO

- Awaken your smart and witty inner wordsmith.
- Think of a story or a concept.
- Express it in 50 words or less.
- Add a relevant image or photograph.
- Send it to us on imagine.thinkedu@gmail.com

WIN COOL

37

38

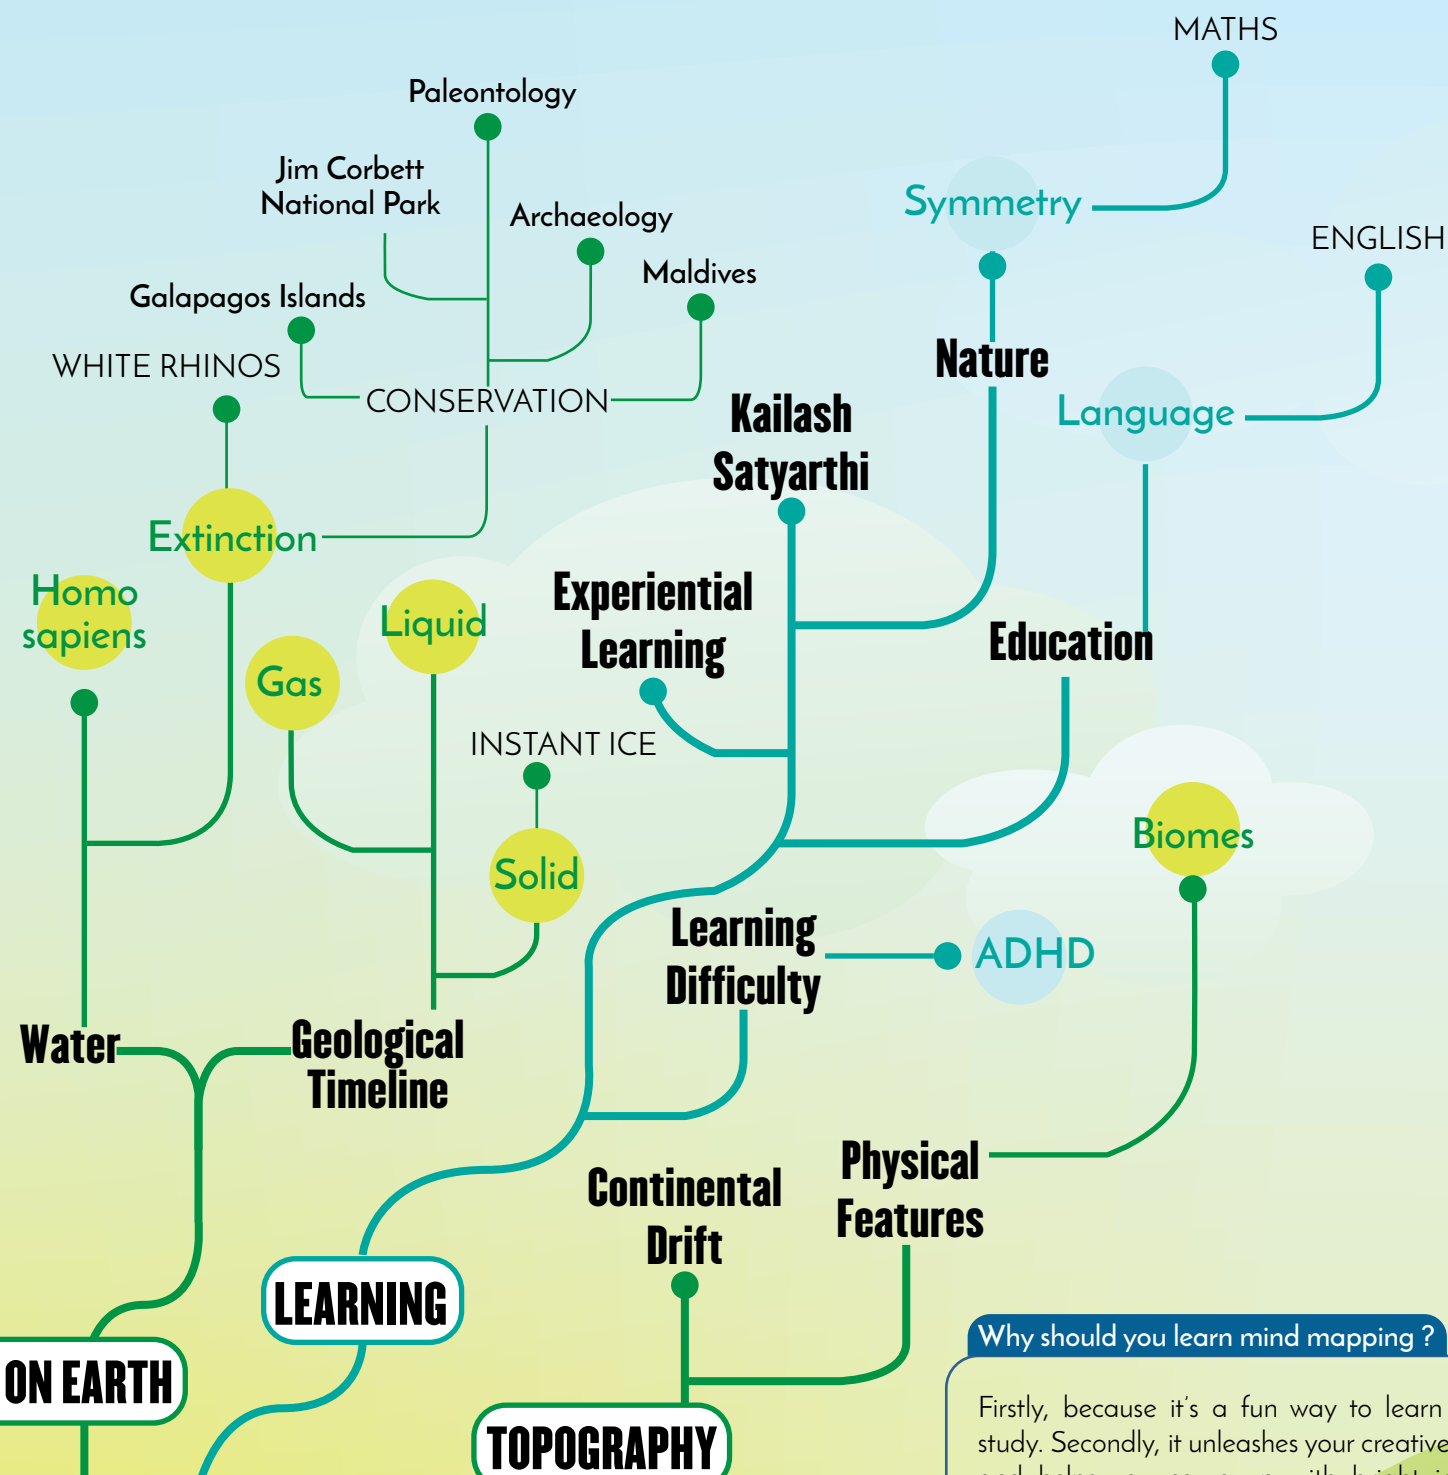

Unravel the mysteries of the past and the scope of our future with evolution theories, anthropology and paleontology. Understand how life began on earth and where it's heading next.

What's a mind map?

Pick a random word and connect it to as many things as you can. It could be images, ideas, instances or more words. If you imagine that on a blank paper, you'll observe that all your connections keep branching out like rivers and tributaries. Together, it forms an independent structure, mapping out your thoughts this structure is the mind map. It is a visual representation or a diagram made of several interlinked words, colours, lines and pictures.

Why should you learn mind mapping ?

Firstly, because it's a fun way to learn and study. Secondly, it unleashes your creative side and helps you come up with bright ideas. Creating mind maps facilitates your cognitive process and makes you remember things better.

The FIRST FISH THAT

INTERROBANG?!

Can Walk Never Left The Ocean?!

Weird, right? The fish that has the ability to try and walk hasn't yet made its way out of the ocean. Considering, the world has already witnessed Flying Fish (Exocoetidae), it's not a surprise that evolution has got another fish on the hook - Little Skate Fish (*Leucoraja erinacea*), one that has the capacity to walk.

A fish that'll not walk the earth. That's not really a first.

You don't have to be sarcastic! This one can walk but really doesn't. According to Science Alert, scientifically, the brain systems controlling the movement of this fish are very similar to those found in mammals. The scientists also recorded footage of little skate fish embryos making walking-like movements along the bottom of a fish tank. They conducted a research based on a genetic analysis of the brain cells of the little skate fish (*Leucoraja erinacea*), one of the most primitive* animals with a backbone.

You mean, the little skate has two legs like us?

The little skate doesn't have legs, but it does have two sets of fins. The large fins are used for swimming, but the smaller pelvic fins allow it to walk along the bottom of the ocean. These types of movements are known as ambulatory locomotion. This also helps in studying the origins and evolution of walking.

Can we watch them walking now?

Maybe in the future. The walking motions we see in the little skate fish today are an evolutionary advantage they got probably about 400 million years ago. They still don't walk the earth.

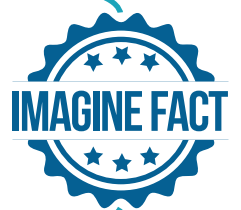

And this is important because ...

It changes our evolutionary timeline! We thought that the first land walkers evolved out of sea about 20 million years ago! But the skate fish discovery pushes it further back by 50 million years. It uses six muscles instead of the hundreds we use to walk and is the last common ancestor of sharks and mammals.

Got it! What else can this info be used for?

Well, this evolutionary research can help scientists understand the the development of nerve networks controlling our limbs, their transformation and the diseases associated with them.

Little skates are an Atlantic Ocean species that live on the ocean bottom. They eat shellfish, worms, and crabs and have strong teeth and jaws to easily crush shells.

OCEANS WILL SWALLOW MALDIVES IN THE FUTURE?

True that! In fact, 20 islands have vanished by far. The beautiful coral islands in the Indian Ocean, Maldives, are just 1.3 metres above the sea level, on an average. Despite being a nation that aims to achieve carbon neutrality* by 2020, Maldives is almost nearing its end.

But how is it even possible?

Unfortunately, in 2004, a tsunami swallowed two-thirds of the country. The Maldives is an archipelago* of over 1,100 islands and the lowest-lying nation in the world. The Earth is undergoing climate change. Sea levels are rising noticeably due to the melting of glaciers and icebergs. If this continues so for the next 30 years, we won't have Maldives!

Is it just Maldives or other islands too?

Island countries such as Kiribati, Palau, Micronesia and Seychelles are on risk of being submerged too.

These islands were formed from underwater volcanic eruptions. These island nations are low-lying and it indicates that they are prone to calamities like floods, storms and Tsunamis.

Oh! Then everything's going to drown? People and wealth?

People can move to a different place. But they will be losing their territory and source of income, as the population depends heavily on tourism, fishing, and agriculture to subsist*.

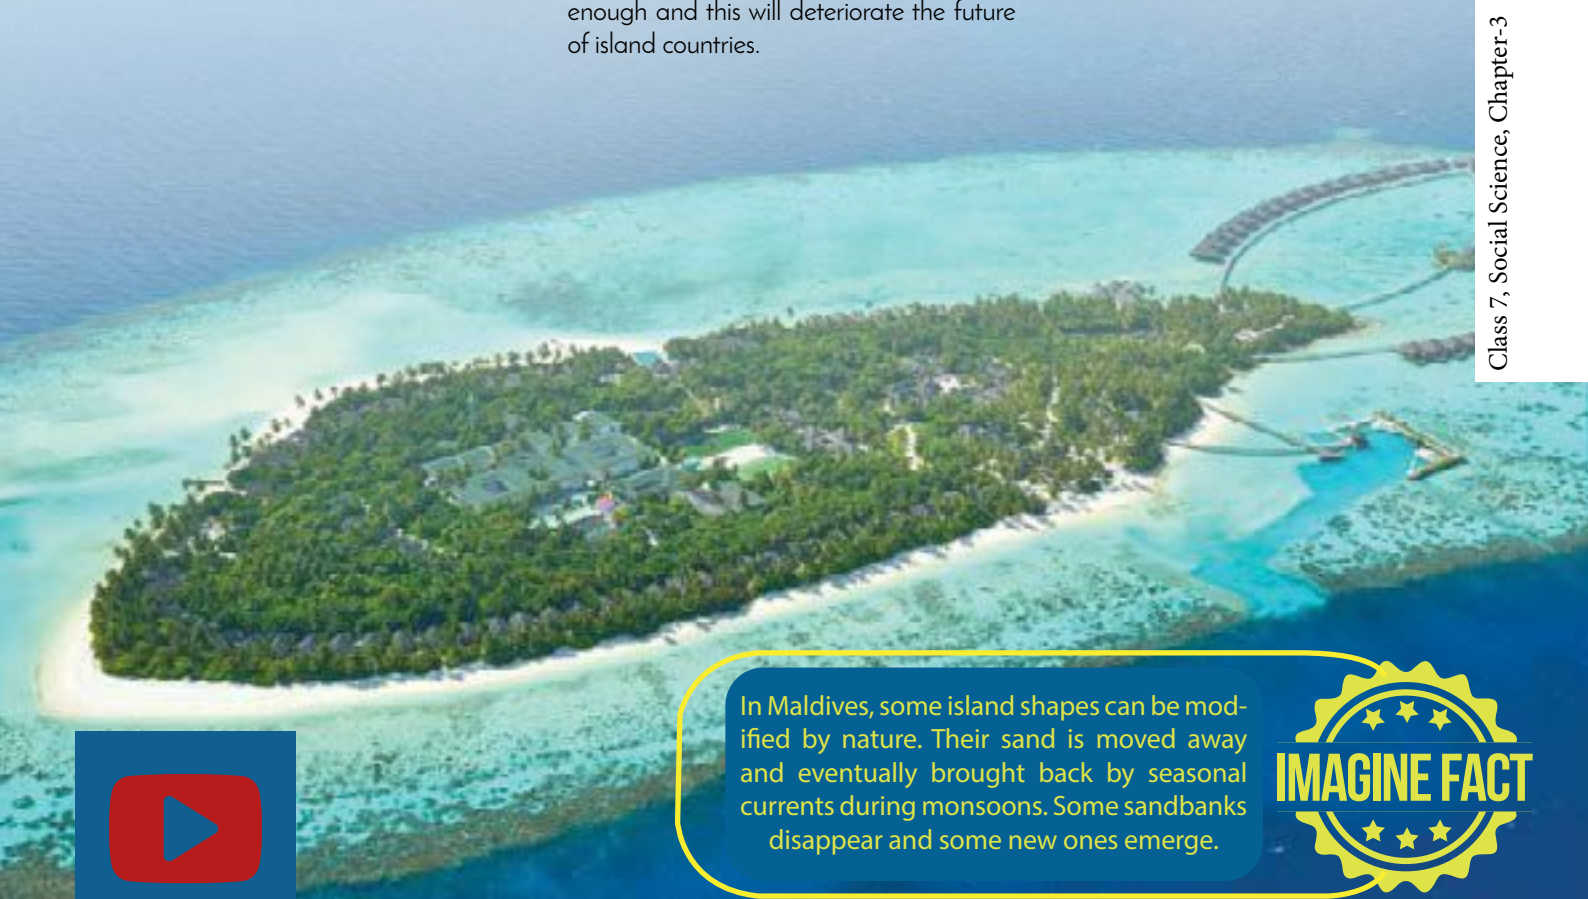

Then how is it becoming Carbon Neutral going to help?

Well, Island countries are the most natural-disaster vulnerable nations in the world. The Maldives is not a major emitter of greenhouse gases. Unfortunately, that's not the case with the rest of the world. The greatest CO₂ emitters - United States, China, Russia and other developing nations do not address climate change enough and this will deteriorate the future of island countries.

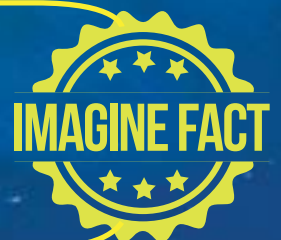

The climate change issue unarguably affects the entire world, though in these certain areas more severely than others.

Don't they have an emergency plan of action?

Environmental security is of primary concern for the Maldivians. Its former President Nasheed implied that buying high-lying land from Australia is a way to secure a safe land. The Maldives must start a campaign targeting the entire world, especially developed nations, to gather high-income countries to take the lead on the carbon-emissions reduction process.

In Maldives, some island shapes can be modified by nature. Their sand is moved away and eventually brought back by seasonal currents during monsoons. Some sandbanks disappear and some new ones emerge.

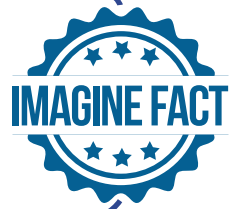

From the time we wake up in the morning, till the time we sleep, from breakfast to dinner, from the clothes that we wear to the oxygen that we inhale, we make use of plants, directly or indirectly. It's impossible to live without them. Do you know why plants play such a pivotal* role in sustaining the life on earth?

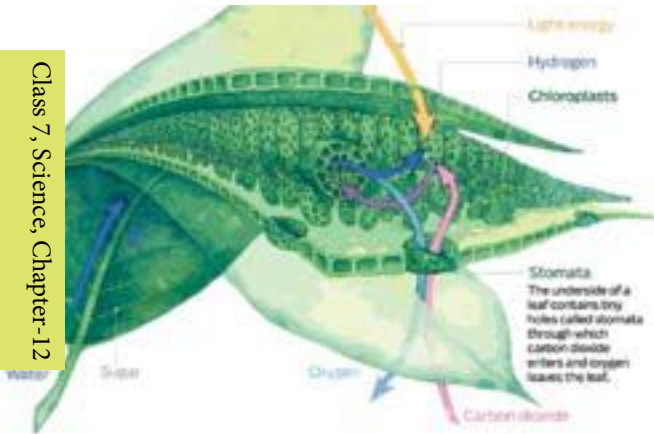

Capture photosynthesis.

Putting together all the light it gets, plant leaves convert light energy into sugar. They produce food for themselves that indirectly feeds every other living organism on the earth. The cells in the plant leaves contain chloroplasts that have green pigments called chlorophylls. Chlorophylls capture light to carry on photosynthesis while stomata (tiny holes under the leaves) exhale oxygen behind inhaling carbon-dioxide.

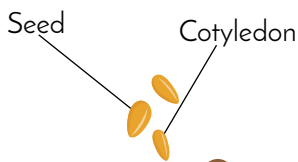

According to the recent research by Albert Ludwigs University of Freiburg, the proteins PCH1 and PCHL in plants help them adapt to their surroundings. Plants react sensitively to changes in their surroundings and possess the ability to adapt to them.

Class 7, Science, Chapter-12

FROM SEED TO PLANT

With the right amount of water, sunlight and soil, a seed converts into a seedling. When the shoot hits the surface the plant is called a sprout. The sprout uses minerals, nutrients and water from the soil where it directs the roots into the ground.

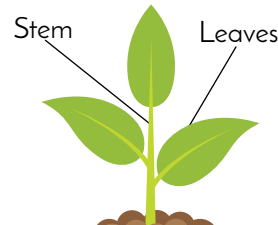

Get set go: Seed

With the nutrients and the sunlight captured, a seedling develops with small leaves. When all environmental conditions are right, the seedling's development begins with germination and formation of three main parts happen.

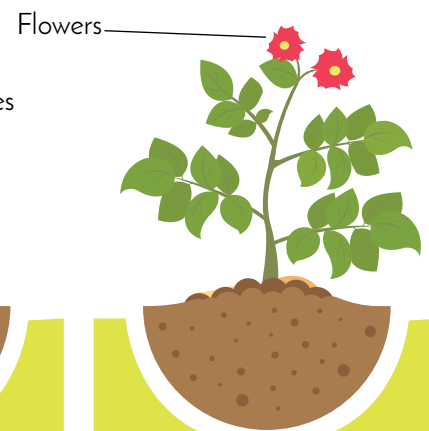

Radicle - Small root
Hypocotyl - Small shoot
Cotyledons - Seed leaves

Hope: Seedling

In this stage, the plant is bigger and has more leaves. Thin branches develop and over a period of time, a young adult plant will grow into an adult plant.

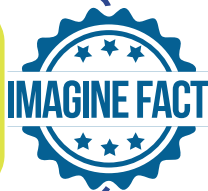

Up & up: Young Adult Plant

The roots get pushed into the ground, getting supplied with water and minerals in this stage. The stem grows tall towards the sky. The plant matures and is ready to reproduce through spores or flowers. After flowers are pollinated, they get bigger and turn into fruits with seeds inside, continuing the life cycle.

Standing tall: Adult Plant

Founder of Microsoft, Bill Gates, is an investor in "The doomsday vault", set in Arctic Mountainside, to save the seeds that could save a post-apocalyptic world.

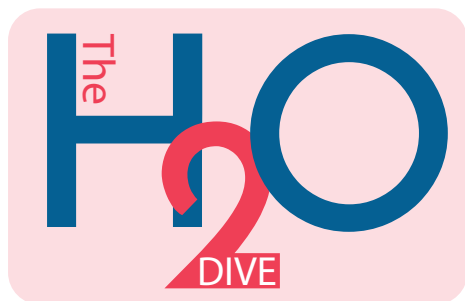

IMAGINE TRIVIA

We kept saying that the environmental conditions play a huge role in the growth and reproductive cycle of plants. How do you think global warming will affect this?

Pivotal (adj): Very important

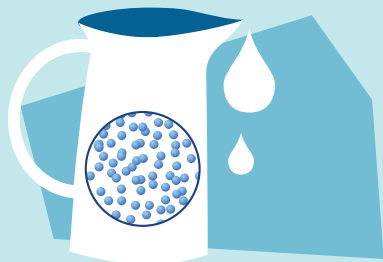

SHOOTING UP from the GROUND

The hot summer sun is upon you making you sweat and thirsting for water. And if that's being poured over some ice cubes, even better! But as you are drinking, did you realize you are having two different forms of water? Liquid water and solid ice. And if the cold water gives you a cold, your mother gives you a cup of steaming hot water to drink. That steam is the third form of water - gas. Water is great at cooling things down and heating them up too! The liquid, gaseous and solid states of water has their own set of properties and qualities.

LET IT FLOW

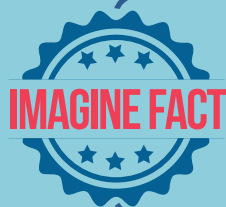

Take a wet sponge and squeeze it. Water drips out of it as you squeeze it harder. That's what happens with clouds too! But, what squeezes a cloud? Amusingly, the coldness! As the air cools, water vapour molecules get squeezed tighter and tighter. When this happens, the vapour turns into liquid water, which is heavier than air and falls as raindrops.

A new study has shown evidence that water exists in two types of liquid states! They are still the same molecules, Hydrogen and Oxygen but the densities of these two liquid phases are different. This can be observed when water is supercooled, that is, cooling it before it starts to form water crystals. Scan this code and watch this video to know more.

IMAGINE TRIVIA

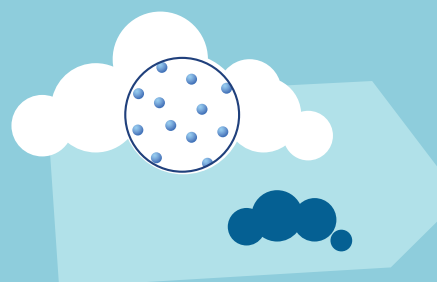

A traditional use of water is generating electricity. America has used this quality of flowing water to build electricity plants. This include the ones at Hoover Dam and Niagara Falls.

When liquid water is evaporated to form vapour, heat is absorbed by the atmosphere. This condensation* is released when the water vapour settles to form cloud water. The heat from sun helps in forming water vapour into clouds. This helps to cool the surface of the Earth.

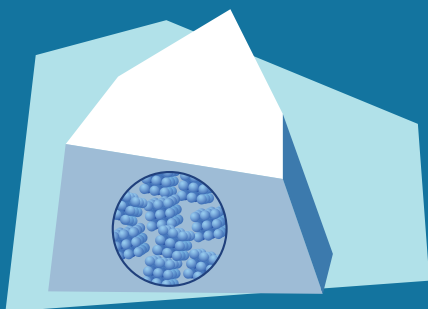

Ice is less dense than liquid water which makes ice cubes float. This property explains the Antarctic ice pier, that assists the unloading of ships in Antarctica. It has been constructed and is in use since 1973.

IT'S ALL IN THE AIR

Class 6, Science, Chapter-14

BREAKING THE ICE

Ice runs miles deep, covering all the landforms in cold areas, especially mountains. While ice is generally frozen form of water, but in polar regions, it is frozen water vapour, or fog that freezes due to extreme cold conditions. The water vapour changing into ice is called sublimation. There are different types of ice. Rime is a frozen water vapour found on trees. From far off it looks like white flags hanging on a tree branch. Then there are Glaciers. They begin as piles of snow in mountain valleys and end up in the moving rivers and oceans after melting. Sometimes, chunks of the glaciers split into the oceans, and float away to become icebergs. As some snow evaporates, freshly fallen snow replaces it. And the cycle continues.

There is ice covering Europa, a moon of Jupiter. Scientists believe it has a watery ocean under its ice. When a place has liquid water, it may have life. Cape Town, Africa is running out of water. Do you think we have another extra-terrestrial place to shift if not Mars?

Shorya's Passion

of Mastering

ART

INTERVIEW

Full name: Shorya Mahanot
Father's name: Aditya Singh Mahanot
Mother's name: Pushpa Mahanot
Age: 11 years
City: Neemuch, M.P.
School: Kendriya Vidyalaya
Art mastered: Abstract Art

ACHIEVEMENTS-

- Speaker of TEDx JSSATE
- "India's child Picasso" recognition by The Guardian, London.
- Recognized by Google as "World's Youngest Signature Style Abstract Artist 2012"
- Performed at legendary cartoonist, Shri R.K. Laxman's residence
- 'Amazing Kid Award' presented by POGO

Most of us at some point have heard our parents say, 'if you want to become something in life, you have to study and get good grades.' Extra-curricular activities usually take a back seat. Today, we bring to you the young Art Master Shorya who transformed his imagination into world-class masterpieces.

What/who inspired you to pursue your interest in abstract painting?

My sisters and my parents. It all began when I sneaked into my sisters' room when no one was watching. They are artists so their rooms were always full of colors, brushes and canvases. Their interest and collection took me towards abstract painting.

Who helped you in turning your talent into a skill?

My father helped me the most. One day when my family was having dinner, I sneaked into my sisters' room and I found a blank canvas and colors. I had fun painting on the canvas. I remember my sister and mom rushing towards me.

But to my surprise my mom and sisters hugged me. Since then my father and my entire family have encouraged me to do what I love.

What is that painting which is closest to your heart and tell us about it?

All of my paintings are close to my heart. As I keep creating new paintings, I experience my imagination and creativity consistently evolving. It's abstract painting that is close to my heart to be precise.

"Painting is the best way to express feelings, you can judge yourself, know yourself better."

What keeps you motivated to keep creating such masterpieces?

My passion for painting. And even the appreciation and encouragement from my family and friends. As such, I have never thought of success. I love my work and I enjoy it when I paint. Success is merely a by-product.

They call you a Child Picasso! How do you feel about that?

I feel great and overwhelmed by this comparison. When I am in front of the canvas, I let go off everything else. I become a different person. I know exactly what I am feeling and what I want to express. I really feel blessed to be an artist. Getting a title as a Child Picasso for doing what I love, I think it is more than a happy thing for me.

I would just like to say that "Don't be afraid". If you have creativity, then this world is a canvas to your imagination.

The Akanksha Foundation

The Akanksha Foundation is a non-profit organisation with a mission to provide high-quality education to the children from low-income communities since 25 years. By 2016, they had 20 Schools in Pune and Mumbai, impacting over 7,000 students. First they established after-school centers for training the students but in 2007 they have also started Akanksha Schools as well.

Vision and Mission:

By 2022, The Akanksha Foundation plans to run 35 schools across Mumbai and Pune, in partnership with the local municipal corporations. They aim to work with educators across India to share their knowledge through a variety of programs.

What sets Akanksha Foundation apart

Akanksha is a unique place where people from varied backgrounds come together to be a part of a movement for change.

- **Excellent Educators-** Akanksha school builds and develops a team of teachers, a school leader, an admin, and a social worker to run the school.
- **Progressive Pedagogy-** The Akanksha curriculum and Network Support Team empowers teachers and school leaders with best practices and uses skills-based approach and rigorous standards for student learning.
- **Parents as Partners-** Parents actively engage in the process in children's development through programs such as the school management Committee, parent literacy classes, parent volunteerism.
- **Accountability to Learning-** All schools undergo a school development review to assess progress and plan next steps for school development. The review is conducted by the school, the network support team, and external stakeholders.
- **Digital Literacy:** Akanksha partnered with the Motivation for Excellence Foundation to provide 3rd-8th grade math classrooms with tablets and access to the material.
- **Independent Learning:** Akanksha has incorporated independent workstations in classrooms to help students focus on practicing and mastering one task.
- **Culture of Reading:** The 'Buckle Up and Read' program helps develop elementary student's reading skills. It exposes children to books that include more text than illustrations.

School Management Committee

Students at Sports Program

Advisory Program and Circle Time

Parent Literacy Programme

Achievements and Awards:

- Awards and Recognition Guidestar Transparency Award 2016
- Rockefeller Center Award – Finalist (Category: Large) 2015
- Highest Pledge Raising NGO Standard Chartered Marathon 2009 / 2010
- India NGO of the Year Award 2010

Their Numbers Speak

- Student attendance- 91%
- Student retention- 97%
- Percent of parents in Akanksha schools participating in School Management Committees- 75%
- Average teacher retention- 75%

Biomes and Biosphere

What's the difference between 'Ecology' and 'Environment'? Most people use the word ecology as a substitute of environment, but they aren't the same. Ecology is the study of the environment while environment is the surroundings or conditions in which a living being operates. Planet Earth is quite amusing. In some places, the temperature doesn't rise above 0°F while in others, it doesn't go below 100°F. There are deserts, forests, oceans, and mountains. Each type constitutes into a 'Biome'.

Tundra

- **Climate:** Cold and dry
- **Temperature:** Less than 5°C
- **Flora and fauna:** The plants include Mosses and short grasses. No trees. Animals include Arctic fox, Reindeers and Musk Oxen.

IMAGINE NEWS:

The melting of the permafrost* as a result of global warming can completely change the landscape and harm the species living there. Depletion of Ozone at the North and South Poles means stronger ultraviolet rays that will harm the Biomes, especially Tundra.

Temperate Rainforest

- **Climate:** Rainy and snowy.
- **Temperature:** 0°C to 20°C
- **Location:** Found along the Pacific Coast from Oregon to Alaska.
- **Flora and fauna:** Black bears, cougars, and raccoons. Fungi are the most important decomposers. Spruce and hemlock trees are typical. Water is abundant here.

Class 9, Social Science, Chapter-5

Desert

- **Climate:** Two desert types- subtropical (hot) and temperate (cold).
- **Location:** Occurs at low latitudes in the basin and parts of Western Asia
- **Temperature:** Maximum temperature- 43.5-49° C and Minimum temperature -18° C
- **Flora and fauna:** Popular for Camels, Feral Horses, Zebratail Lizard, Gopher Tortoise. Plants like the cactus, Prickly Pear, Primroses

Tropical Rainforest

- **Climate:** Hot and Moist
- **Average temperatures:** 18° C
- **Location:** Found near Equator
- **Flora and fauna:** Great diversity of plants. Ideal for bacteria and microorganisms. Popular for great apes and monkeys. Not a lot on forest floor- thick leaf canopy blocks out much of the light.

Permafrost (n): Ground, including rock or soil, at or below the point of water 0 °C
Unveil (v): Reveal

Emergency: We better port to Mars now! Every minute two acres of farms, forests, deserts, and other types of lands get eaten up by urban population. Unveiling* the facts and figures, the grave mistakes of the mankind have landed us here:

Earth's ever growing population- The popula- tion now is about 7 billion. Within next 20 years, it's estimated to increase by 1.5 billion. Already, around 700 million people face serious water and food shortages across the world. Alert!

The habitat destruction- Hunting in the past and polluting in the present, leaving no scope for the future. Humans are driving some plants and animals off the planet forever. And guess what? We're doing it.

The Apocalypse- A hotter planet will cause polar ice sheets to melt. More liquid water would upset the weather that would cause storms and droughts. The food production worldwide could be disrupted. No food, no life. End of the story.

IMAGINE NEWS:
Italy dumps plastic bags production with Europe's First Nationwide Ban.

Taiga

- **Climate:** Cold and dry
- **Average temperatures:** About +5° to -5° C.
- **Flora and fauna:** Coldness leads to food shortages here. Animals in the taiga hibernate in the winter. Known for Amur Tigers, Snowshoe Hare, Porcupine, Grizzly Bear and Elk. Famous for Pine cones, Polytrichum Moss and Lichen

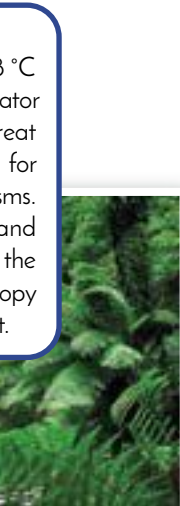

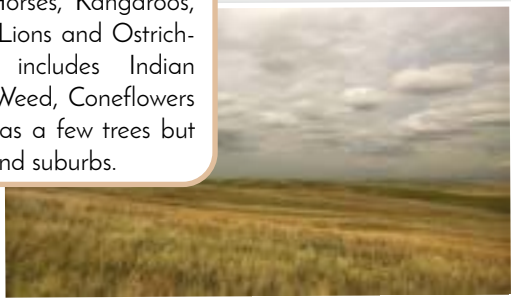

Savannah

- **Climate:** Wetty with a lot of rains. Winters tend to be warm and wet. Seasonal droughts and fires are prominent
- **Average temperature:** Over 20°C.
- **Flora and fauna:** Has lots of trees and shrubs. Kangaroos in Australia and Zebras in Africa are popular.

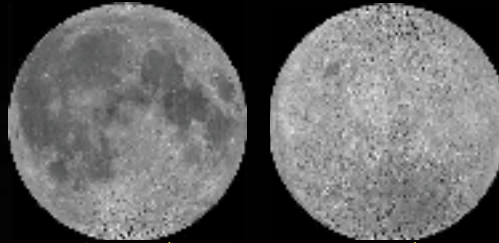

Temperate Grassland

- **Climate:** Dry climate with hot summers and cold winters
- **Average temperature:** Below 0°C to about 20°C
- **Flora and fauna:** Grassy home with Cows, Wolves, Horses, Kangaroos, Zebras, Rhinos, Lions and Ostriches. Vegetation includes Indian Grass, Butterfly Weed, Coneflowers & Sunflowers. Has a few trees but supports farms and suburbs.

The MAN MERGED MOON

A few mythologists say it was a supernatural power sent by God while ancient astronomers said it was a natural rock satellite present already. A lot of them imagined that there was new life present right there. With mankind's tales of aliens invading the earth, epics like Ramayana depicting the beauty and fantasy of the Moon, religions like Islam worshipping its purity, mysteries like in the Hound of Baskerville, earth's Moon has been significant since the beginning of time!

Near Side

Far Side

So luminous* yet non-luminous

The bright moon that we see at night doesn't really have light of its own. It is lit, illuminated by the rays of the sun. This is just by reflecting 12% of sunlight. The brightness of the moon as seen by us is dependent on other factors too such as how clear or

cloudy is the sky, the distance between sun-moon, moon-earth and the phase at which it is.

The rise and fall

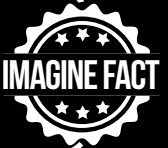

The water level rises and falls in the oceans every 12 hours of interval in the form of tides. They happen because of the gravitational pull between the Earth and the Moon. The gravity on the Moon is one-sixth of that on Earth.

The perceived evolution- every once in a month:

The Moon waxes (grows) while going from new Moon to full Moon. It wanes (decreases) when it goes from a full Moon to a new Moon. The moon's rotation around the earth and its revolution from new moon to full moon take the same amount of time, 27.32 days. Quite a synchrony* with the Earth it is! Since the Moon's rotation happens with single side facing the Earth, the side that faces the Earth is called the near side. The part of the Moon we can't see is called the far side.

A new Moon is nearly or totally invisible from Earth. When the Moon is between Earth and the Sun, the light from the Sun falls on the far side of the Moon.

Digging deep into the Craters

Songs, poems and other literature commonly use moon as a symbol or comparison to beauty. But in reality, as we move closer and closer to the Moon, we can see its imperfections and damage due to previous and present meteorite explosions.

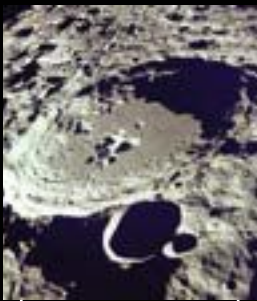

Luminous (adj): Giving off light

Anticipate (v): Expect or predict

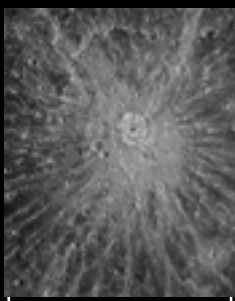

Synchrony (noun): Simultaneous action and development

Craters:

Caused by cosmic dust, moon has craters with the biggest crater being 700 million miles wide.

Rays:

The meteors, comets, and asteroids still keep hitting the Moon really hard. This impact sends splashes streaks out of craters, forming called rays. They can be 1,000 miles long.

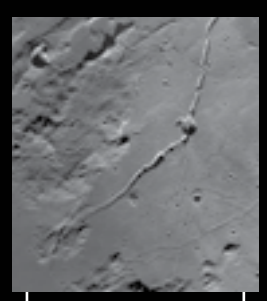

Maria:

It is the lava that hardened after oozing from the Moon's crust. Maria makes up to 30% of the Moon.

Highlands:

The few mountains on the Moon are Highlands that are present through the walls of giant craters.

Rillers:

These are long narrow valleys. Some Rillers were caused by cracks on the Moon and others by flowing lava.

Through thick and thin- astronauts with armours.

It's a known fact that Apollo 11 was a successful mission up to the moon making Neil Armstrong the first person to land on it. More than 4,00,000 people worked to get them there. Some pre and post missions of Apollo 11 faced some heart wrenching fails and dangers. During Apollo 1 in 1967, a fire broke out killing astronauts Virgil Grissom, Edward White, and Roger Chaffee. During Apollo 13, the spacecraft broke by a small explosion on the Moon. Astronauts Jim Lovell, Fred Haise, and Jack Swigert spent four days struggling to return to Earth.

Man's first landing on the Moon is going to complete 50 years in 2019. Vodafone plans to create the first 4G network on the moon to support a mission by part-time scientists.

It was last in 2013 that China landed the Yutu rover on the Moon and no one else did after that. But Indians are ready to change this with first lunar rover to be launched in the year 2018 by Indian Space Research Organisation (ISRO)

IMAGINE TRIVIA: Real-time words of the 1st man on Moon, Neil Armstrong.

"It was really, really hot on the moon, 200 degrees Fahrenheit. We needed protection."

"We cheated just a little, and very briefly bounded off to take pictures of some interesting bedrock."

"That's one small step for man, one giant leap for mankind."

"We didn't know how far we could go in our space suits."

ICING

on the WATER

CREATE

How cool do you think it is to get an ice cube instantly without freezing the water? Here's a method that can save you from the summer heat by converting water into ice within seconds and also pose a neat trick to show off in front of your friends.

Things you'll need:

Procedure:

1

Fill the bowl with the ice cubes. Place the bottles of filtered water into it. Make sure the bottles are in the centre of the bowl.

2

Pour salt over the ice and top up with water until it fills the bowl to the level of the bottles' lid.

3

Do not disturb the bottles while they are cooling, as the smallest knock can form crystals in the water. Carefully check the temperature of the water using a thermometer. It should cool down to -8°C .

4

Carefully take one of your bottles out of the bowl and check if it is still liquid water. Place it on the table.

5

Holding it firmly, give it a sharp hit on the table. You will see ice forming from top to bottom of the bottle.

6

It's amazing to see that water turns instantly into ice! Take the other bottle out and slowly twist open the cap. You'll find the water inside freezes from top to down.

What happens here...

Salt poured over the ice, helps the temperature go below the freezing point i.e., 0°C . In the bottles that are placed inside the ice bowl, some molecules are freezing and some others are still in liquid state. When two bodies of different temperatures come in contact, they try to balance each other and become uniform. This is 'dynamic equilibrium'. As this mixture of water and ice reaches 0°C there will be a balance formed. Slowly, the salt molecules start to replace the water (liquid) molecules inside as salt cannot interact with ice and disrupting this equilibrium. When the water cools down below 0°C more molecules will freeze to achieve balance once again. The supercooled water inside the bottle along with the normal water freeze when you tap it or open it. This allows only 10%-20% of the water to freeze forming crystals and doesn't create a solid chunk inside the bottle. The more salt you add, the cooler the icy water gets.

The Journey Of Human Evolution

About 150 years ago Charles Robert Darwin explained the evolution of human beings through his theory of evolution by natural selection. But even before that there were two naturalists Comte de Buffon and Carolus Linnaeus had already put us human beings in the same biological "family" as apes. This family, called the Hominids also includes chimpanzees, gorillas and orangutans! And why not? We do share 97%-98.4% of our DNA with them.

However, getting from a biped* ape to a highly intelligent being took millions of years, leaving behind at least 15-20 ancestors in between with some very tangled timelines and disagreements in the scientific community. Today, we shall try to sort some of it out for you.

The magical evolution

Homo

2,00,000 years ago-present

Homo nean

4,00,000 years ago to
40,000 years ago

Homo

1.8 MYA to 143,000
years ago

Done

Homo

2.4 to
1.5 MYA

The last human evolution happened nearly 200,000 years ago. Do you think we will evolve further? What do you think we'll evolve into next? What physical and mental traits will remain and what will nature do away with? How much of this do you think will be influenced by technology?

Australopithecines

3.9 to 2.9 MYA

Early
too

There was a time when Homo erectus and Homo sapiens lived in the same era. Strange isn't it? They were also Neanderthals and Denisovans. These species also used tools and hunted in groups.

Neanderthals were well built and were very strong. They had thick brows and big noses. They practiced their own rituals and buried dead bodies. They lived in Western and Central Europe and much of Asia. Their barrel-chested bodies were well adapted to surviving cold winters.

Denisovans were discovered lately in 2010 in the Denisova Cave, Siberia. According to the archeologists, bone needles and other tools show that they used tools extensively. It was also found that they lived at the same time as Neanderthals and Homo sapiens.

What after Homo Sapiens?

According to the theory of natural selection, traits* of species evolve based on the environmental conditions around them. The ones better suited to adapt will survive.

For example, there was a time when giraffes with long necks and short necks existed. The ones with long neck had the evolutionary advantage of height, strength and being able to eat leaves from tall plants. Hence they survived. We don't see short necked giraffes anymore. Some scientists believe that we won't evolve anymore as technology has given a brutal blow to natural selection.

20 Biped (n): an animal that uses two legs for walking.

The Evolutionary Timeline

All of human evolution happened in Africa and from there they migrated to other continents. In the 1960s, paleontologists led a study on fossils that concluded that a 14 million year old ape, Ramapithecus, was the earliest ancestor on the human line, based on the shape of the jaw. The last common ancestor (LCA) between us and the apes existed around 6-7 million years ago. The ape family split into two groups: hominins, the line leading to us and apes such as chimpanzees, bonobos, and gorillas. Humans are represented with the genus "Homo"

Stone Age:

The early homo, Homo Habilis were found during Stone Age in Africa 1.5 to 2.4 million years ago. Then came Homo Erectus who was likely a lot like Homo habilis, but taller and thinner. Gradually there were Homo neanderthalensis and Homo floresiensis who evolved into Homo sapiens. They evolved in 200,000 BC leading to the Bronze Age and Iron Age.

from Apes to Humans

sapiens

(Modern Humans)

derthalensis

(Earliest clothing, Earliest cooking)

erectus

Early fire use

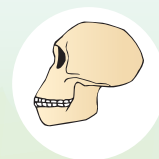

habilis

Early exit from Africa

stone
ols

IMAGINE TRIVIA:

Have you by any chance tried to spark a flame with a piece of flint? Homo erectus did and became masters of fire. They hunted and cooked food using the fire. They also lived in communities finding their own tribes.

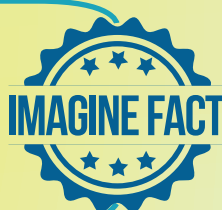

Class 10, Science, Chapter-9

Some say that as historical evidence shows, our brains and forehead will become bigger. We will become physically weaker with lesser muscle mass due to dependence on machines for work.

Transportation and a mix of races increases this complexity as that would mean environmental conditions are not constant and neither are all the traits. Draw us how you think the next evolved Homo will look like. Do you think they'll have stronger and longer fingers due to the use of computers and mobile phones? Send in your artwork to imagine.thinkedu@gmail.com.

This is the oldest fossil found near Africa. It revealed that the jaw and the teeth are estimated to be up to 194,000 years old. Now it's not just the time to study evolution forward but backwards as well.

Trait (n): a distinguishing quality or characteristic

Genomes(n): the complete set of genes or genetic material

Who got into cyber security trouble due to data breach?

Cambridge Analytica, a data mining company is supposed to have improperly used Facebook user data to influence the 2016 Donald Trump Presidential campaign. It was also used in the Brexit campaign. A data breach happens when data (or information) about someone or something has been illegally used or shared by someone who is not authorized to do so. For example, everything you log into an app using your facebook account, some of your info gets shared with the app, with your permission. In 2015, a Cambridge psychology professor, Aleksandr Kogan created an app called "ThisIsYourDigitalLife". It was a personality quiz and more than 2,70,000 Facebook users took the quiz. Kogan's company Global Science Research shared the info with Cambridge Analytica which is now found guilty of exposing the personal information of Facebook users. About 87 million users were affected with most of them residing in the USA. The data was also used in the Brexit campaign. This incident brings to light the need to know about how to protect yourself in the digital world and need of better laws in cyber security.

Where did the world's last male northern white rhino die?

The world's last male northern white rhino (Sudan) was euthanized* in Kenya by a veterinary team. The rhino fought for years suffering from infections. Sudan was 45 when he died. The second-to-last male, Suni, died in 2014 from a heart attack. Both Sudan and Suni were too old to be fertile by the time they were brought to the Ol Pejeta Conservancy in Kenya in 2009. There are only two remaining now. His daughter, Najin, and granddaughter, Fatu. This species is nearing extinction and is on a high need for preservation.

ON AIR

Why was there a protest across the world for strict gun laws?

People across the world, from London to Paris to Mauritius to Mumbai protested for strict gun laws. The protests took place on the streets to attract the attention from the Government. The mass demonstrations took place under the banner "March For Our Lives". The protest was instigated by Marjory Stoneman Douglas High School students. The march was to ensure that no more innocent lives are lost by gun violence like the shooting experienced at the school on February 14. It was one of the biggest rallies in Washington DC, and was joined by 8,00,000 people including celebrities like Miley Cyrus, Ariana Grande, and Jennifer Hudson who lost their family members 2008 shooting.

Newsroom

What is NASA's new space program?

NASA recently launched "Hot Ticket" program, where we can get "moment in the sun". All we need to do is to submit our name to them. The agency will put all the names on a microchip and they will accompany the mission to observe sun's atmosphere closely. This is something that was never attempted before. The compact car-sized Parker Solar Probe is scheduled to launch from NASA's Kennedy Space Station in July 2018. The data collected by the spacecraft will help the scientists to know about the sun's corona and find ways to predict the solar flares.

Which company is ahead of Amazon to buy Flipkart?

According to a new report, e-commerce giant Amazon is interested to buy its rival in India, Flipkart. Jeff Bezos, CEO of Amazon, is the world's richest man and stated that they have intentions to buy Flipkart. But on the contrary, Flipkart doesn't seem to be interested in the offer. Rather it is expecting to get into a partnership with Walmart. Amazon is planning to spend \$20 billion to acquire Flipkart but Walmart is in talks with Flipkart to buy 55 per cent of its shares. People working closely with Flipkart have said that the deal with Walmart shows a higher chance to get through than Amazon.

How is the continent of Africa tearing into two-halves?

A huge crack, stretching several kilometers long, suddenly appeared in south-western Kenya. The tear showed a constant increase and it which continues to grow and caused part of the Nairobi-Narok highway to collapse. It was followed by seismic activities in the area. The Earth is ever-changing and with some aspects, the change is almost unnoticeable. Every now and then some drastic activity takes place and leads to news of the African continent splitting into two. Although most of the time rifting* is not clearly visible, the formation of fissures and cracks along the old faults continue to move apart. This can result in earthquakes.

SPORTS

- Lionel Messi back to lead Barcelona against Roma
- Badminton's New Service Rule to be exactly 1.15 meters above the ground at the time of service will not be used at Commonwealth Games 2018
- Rafael Nadal reclaims number one spot in men's after Roger Federer slips
- MS Dhoni received Padma Bhushan and walked up like an Army man to receive the award.

Euthanize (v): Put an animal to death humanely.
Rifting (v): tear or force (something) apart.

The Strokes of Symmetry

The Strokes of Symmetry

Symmetry exists everywhere. From a simple structure of a leaf to complex theories like cosmic connections, use symmetry as their base. Beautiful architectures like Taj Mahal and intricate weavings like spider webs have symmetry incorporated in them. While every field of study has it, geometry is the subject to which all of this boils down to.

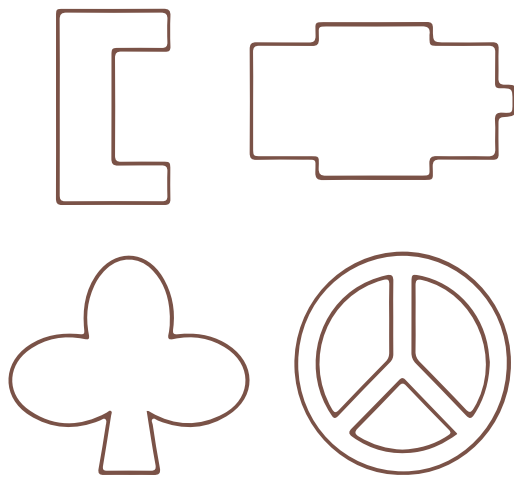

In terms of math the easiest way to put the concept is to understand it with an example of a square. By drawing lines to make partitions equally or rotating it by 0, 90, 180 or 270 degrees, it all looks the same as the other half in the end.

Reflectional symmetry: It is when you draw a line from the centre of any figure, the size and the shape to its opposite side will be equal.

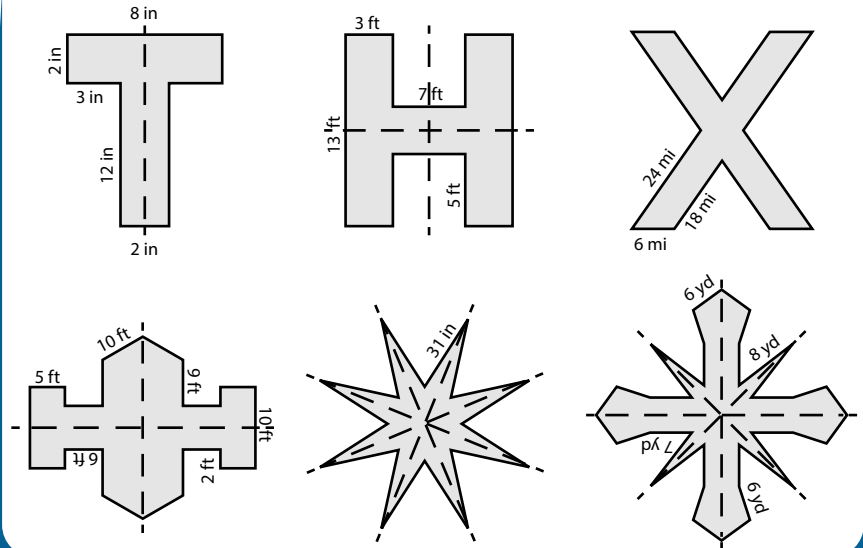

Radial symmetry: It is when an object is rotated around a circle, equidistant from the point in the centre.

Translational symmetry: When the squares move from the background to the foreground they aren't really equal in shape and size but get consistently bigger as they get closer. This implies motions and movements like in videos and gifs.

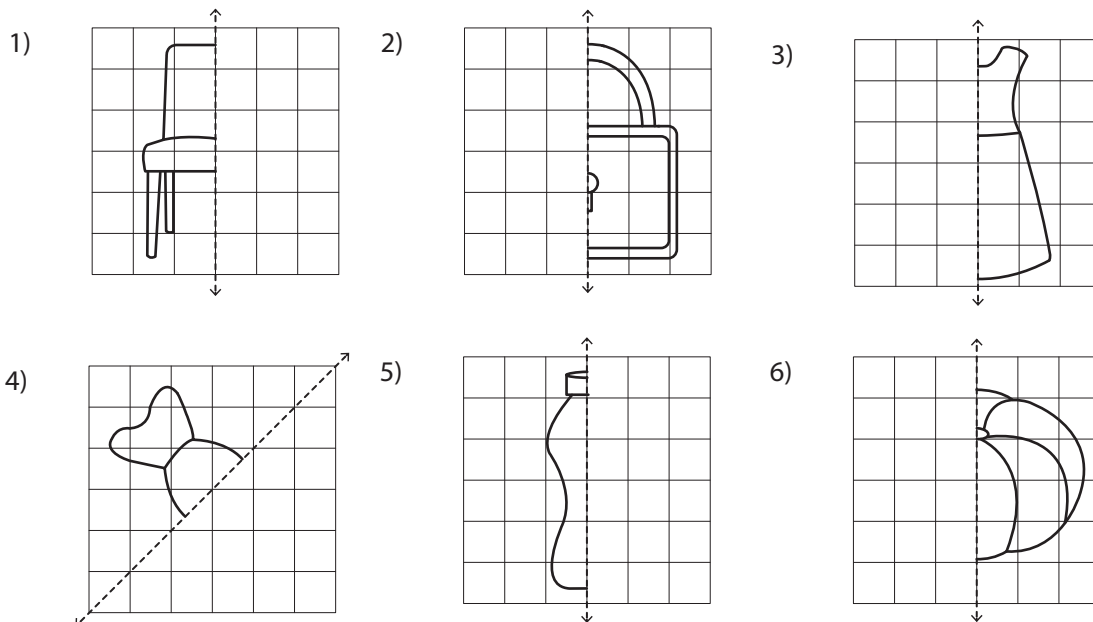

Draw the lines of symmetry by striking the right balance in the pictures

Find the perimeters and the areas of the polygons, using the concept of symmetry.

Draw the mirror image and complete the designs below

FOOTBALL FIELD

GEOLOGICAL TIMELINE

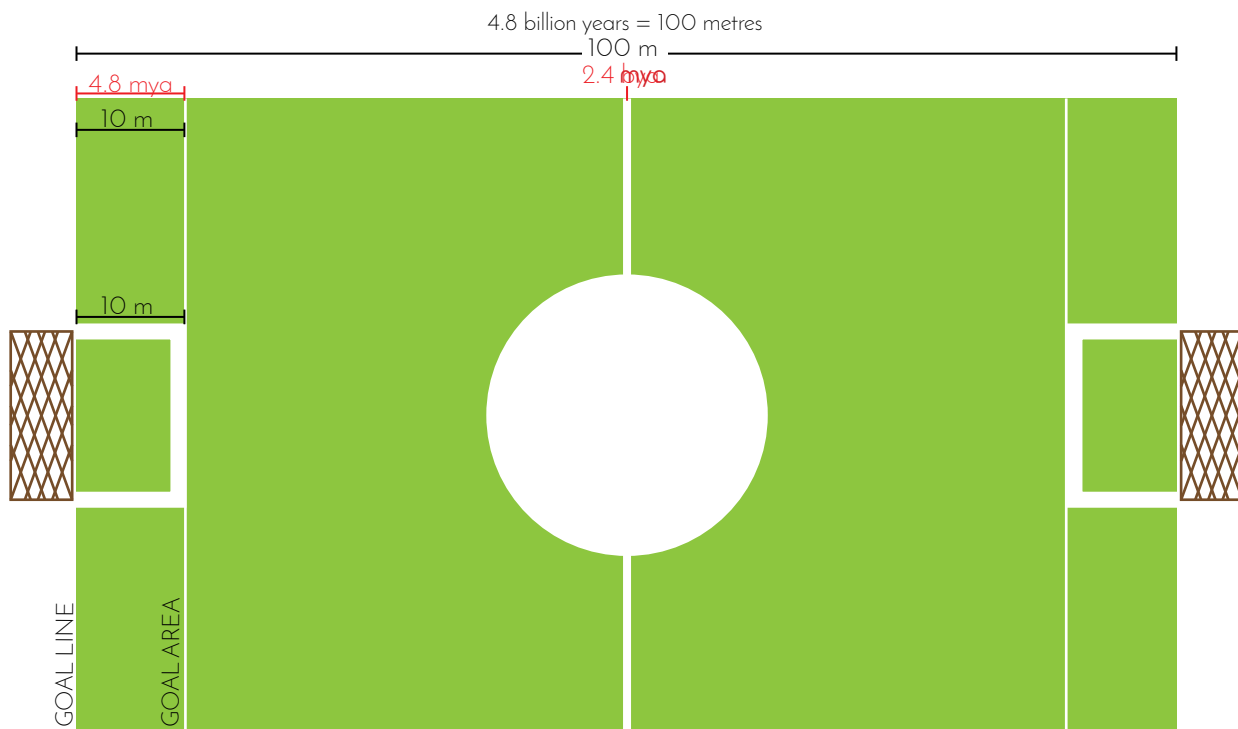

The earth is approximately 4.8 billion years old! Since then, it has come a long way. An object that was just a fireball underwent several topography changes; land masses in the form of continents disintegrating, life beginning and some of it becoming extinct. Imagining the evolution of 4.8 billion years is not easy. But creating a simple geological* timeline drawn to scale using math makes it easier to understand. Ready?

WORK IT OUT

If you do not know what our geological timeline is, scan the code here to understand it. Then, compare the geologic time to the length of a football field, measuring 100m.

Use a 1.2m sheet of paper for your timeline. Draw a model of a football field, using the following scale 1m = 1cm. If you divided 4.8 billion years by 100, then each metre would equal _____ years.

The extreme left would be the very beginning - 4.8 billion years. As you keep moving forward, mark the timeline at every 10 metres (i.e., 10 cm according to your scale). This gives your your first 4.8 mya (mya = million years ago) 10m = 480mya

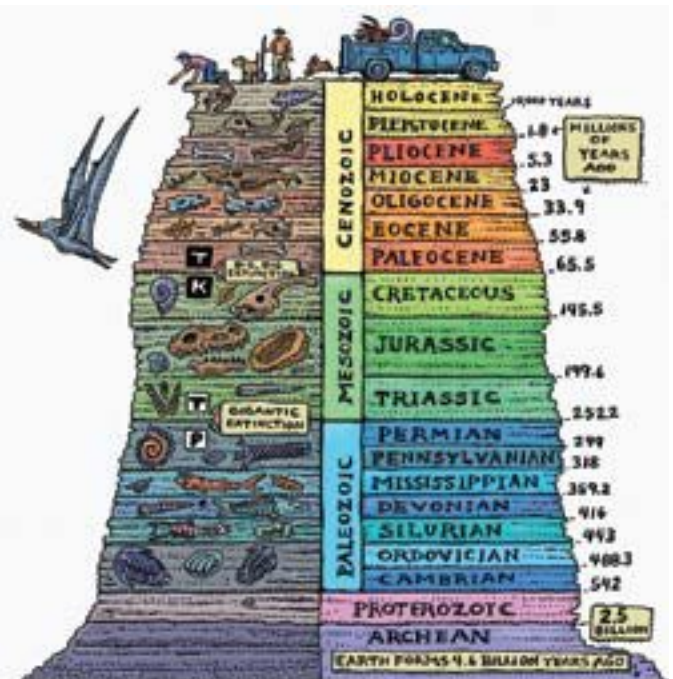

Then, using different coloured markers draw a vertical line to show the beginning and end of each of the following eras.

- Cenozoic Era (65 million years ago [mya] to present)
- Mesozoic Era (250 - 65 mya)
- Palaeozoic Era (570 - 250 mya)
- Proterozoic Era (2500-570 mya)
- Archaean Era (3800-2500 mya)
- Hadean Era (4600-3800 mya)

Take the help of your classmates and make this activity more fun. Find out what earth was like in each of these eras. Use the following headings in your description:

- Periods in this era
- Life in this era
- Climate in this era
- The view of Earth from space showing land and sea distribution

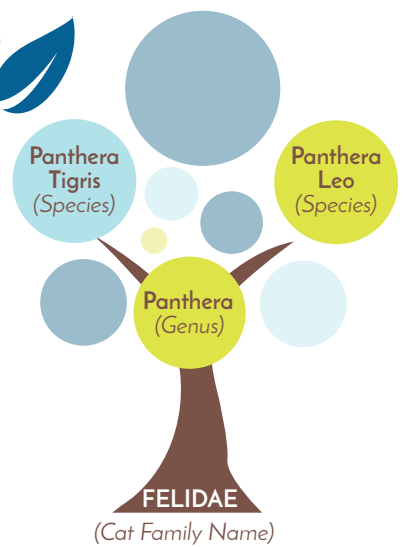

Note: We'd like to thank the West Coast Fossil Park for inspiring this activity.

THE Namesake in nature

If there are two boys named Rahul in your class, how would you differentiate them in the attendance register? In the living world, organisms are classified by their names. Carolus Linnaeus, the botanist introduced the Binomial Nomenclature, as a way to name and classify living organisms. Just like you have a name and a surname to differentiate yourself, organisms too are given two names. Eg: Lion is classified as *Panthera Leo* and Tiger as *Panthera Tigris*. Both belong to family *Felidae* and genus *Panthera* but different species.

Two — **BI-NOMIAL NOMENCLATURE** — System of naming
Name

Solve the word puzzle below and test your knowledge in scientific names (SN)

ACROSS

2. *Allium cepa* is SN of this plant that is a remedy for curing common cold.
7. *Scapula* is the SN of the part of the body that connects bones in the upper body.
9. One of the scariest underwater creatures on the planet, immortalized in movies and inspiring fear in beachgoers. SN: *Carcharodon carcharias*
11. This sour fruit is originally from India with SN *Citrus Limonum*
13. Mouth is also called oral cavity. It is also known as this ____
14. Popularized by figures as Tony and Sher Khan, which feline species has the SN *Panthera tigris*?
15. Which species native to Australia is classified as *Vombatus ursinus*?

DOWN

1. The botanical name of gums is what? It is named after the tissues surrounding the teeth.
3. This fruit, due to its low antigen content, is useful in the management of immune-mediated diseases. It's SN is *Pyrus Malus*
4. Those who decided the SN for this bear also did not have those two adjectives in mind when assigning a SN. This species of bear is *Ursus arctos horribilis*
5. Ginger plant is closely related to onion genus. What's its SN?
6. What is the "scientific" name for Brain? This is encased within the Cranium and gets its name from there.
8. *Rosa indica* is a SN of this plant within the family of Rosaceae, that contains over 100 species
10. This canine species used to roam freely along much of eastern North America, but today it can only be found between the states of Florida and Texas. SN: *Canis rufus*?
12. Coccyx is the scientific name of this part of human body? It's the remnant of a vestigial tail.

The Role of Experiential Learning

-Nancy Katyal, Image and Behavioural skills coach, Founder@ThePerfectYou

In my life, I really value the connection with the outside world - whether in the form of work assignments, mingling with people or just the experience of observing something unique. This connection has been at the centre of various learnings I have been able to acquire. All sorts of learning start from a need and that need makes you want to do something. So is that with the education of students, to that matter education of every being.

The modern schooling today encourages experiential learning in the form of outdoor sports and meetings and events. With my own daughter, Ishita Katyal, I see that she is benefiting much more than how it used to be in our times. Most of the teens I meet have some sort of stories of experience they gained from a need that compelled them to do something about it. Eventually all forms of help are self help and experiential learning for me is at the top of the pyramid. In the world of digital games and superheroes and fast technology we are more than happy to get vicarious* pleasures.

My own personal story of profession I chose is drawn out of strong desire to experience an area I truly loved. I was drawn to the profession of behavioural skills and came out of the training with a strong need to learn and be a trainer/coach myself. I truly believe that a need to learn something should be formed through an action that will immerse your heart into that need. One of the barriers to such learning is that - we don't allow the need to harness* its true power.

I think what holds people back at times to take the initiative to experience is the fear of failing. To the young generation that experiences change and evolution on a fast track, my view is that fearing something is a good sign. It means you have taken the first step forward to start thinking about realising the need. You can make fear to be your friend and tell it that I respect you and let us together experience this and see what happens. Your fear will see your authentic and true self and let you proceed without holding back. Life has given us all a chance to leave our mark in some way or the other - and you cannot lead that without a need that is compelling enough for you to try and experience the need. Age is no bar to developing a deeper connection with world and you will realise that the experience gained will make you younger as you age. When you stop experiencing the outside world you start to age in mind.

So go on, stretch your wings, take your fear along and experience this wonderful world we live in.

“ I tell my friends that a morning cup of tea experienced with an open and fresh heart relating to the environment around you will taste much better than tea as a ritual ”

Vicarious (adj): Experienced in the imagination through the feelings or actions
Harness (v): control and make use of

Empowered Endurance

KAILASH SATYARTHI

Since his childhood, he always questioned the unjust and wrongful. As a five year old, he was disturbed by the sight of a small boy working with his cobbler father when he was at the school. This instigated* him to raise his voice against this. He is also the founder and president of the Global Campaign for Education, a movement that is working to end global education crisis.

Kailash Satyarthi, born on January 11, 1954, is a human rights activist. He started his global movement against child slavery in 1980. The movement founded by him, 'Bachpan Bachao Andolan' have liberated more than 83,000 children from exploitation.

The world cannot overcome its crisis, problems and agonies by just sitting and thinking the reasons behind them but by responding, finding and evolving with the solutions. This time, we've brought for you, a few stories of those who rose above their circumstances and evolved as persons to achieve the best in their fields of work.

MARY ANNING

Mary Anning was born in 1799 in Great Britain. Her family lived in poverty and anonymity. Her occupation was fossil collection and distribution. She was known for her contribution to fossil collection and paleontology*. She sold fossils from Lyme Regis in Britain, until the early 1820s. Mary Anning and her contribution to paleontology was considered against her social status and her gender. Many scientists of the day are not able to believe that a young woman from such a background could possess such knowledge that helped the world. She has been credited with the first discovery of ichthyosaur fossils- an extinct marine reptile. She made many great discoveries from fine ichthyosaur skeletons to discovery of the first plesiosaur- a marine reptile.

Paleontology (n): the branch of science concerned with fossil animals and plants
Instigated (v): bring about or initiate

Known as the "King of Pop" Michael Joseph Jackson was born on August 29, 1958. He was an American pop singer, songwriter and dancer. As a child, he was the lead singer of his family's group, Motown. He spent all his time rehearsing and practicing his art. At first, Jackson played local gigs and built a strong following. In the year 1983, on television, Motown performed their No. 1 hit "Billie Jean" and debuted his famous dance move, the Moonwalk. From there he went on to a career that astonished the entire world delivering No. 1 hits.

MICHAEL JACKSON

-Dr. Jayshree Sanghani, Counseling Psychologist and founder of Reach Beyond NGO

As a Counseling Psychologist and founder of Reach BeYond NGO for Positive Psychology, helping children, parents, teachers and management, left me with numerous experiences and understandings, helping me evolve in the subject and practice.

One day, I happened to attend, Aarti from class 6, who was brought by her mother and class teacher. She was intelligent but she struggled to focus on homework. Her parents and teachers were after her, cajoling* her. 'She disturbed the whole class by asking irrelevant questions. She couldn't sit in one place'- they said

Once the teacher left my place, the mother started sobbing* asking me what to do with that child. I first calmed her down and administered her with a Psychological Test. Based on the results I explained to her that her child was suffering from 'Attention Deficit Hyperactivity Disorder (ADHD)'.

The conversation went about this way.

Mother: How could you say she has this disorder?

Me: Her IQ is average so she is intelligent.

Mother: Does this mean that there is no hope for her to overcome this disorder?

Me: No! There is medication a Psychiatrist can give and a Counselor can give her therapy. There are also tips that parents can take care of.

Mother: What are they?

Me:

1) Be aware of the situation that your child is intelligent but has a genuine problem. It can be resolved by proper approach and attitude.

2) Accept and love your child. That your child is intelligent but has difficulty which can be helped by standing by her.

3) You should be keen about a few more things like,

- Medication can be prescribed only by a psychologist or a clinical psychologist.
- Find out her other talents and encourage them.
- She has to undergo remedial therapy.
- You may find many tips when you Google. Note them down and discuss with the therapist and implement them in tandem with her.
- Do not label her.

Mother: Thank you for showing some hope for my child. I will surely remember these simple tips.

To make people overcome the taboo of seeking help. Any one of us could be going through similar problems. So seek help at the earliest. As when you have fever you visit a Doctor and take treatment, in the same way approach a psychologist counselor as Mental Health is very important

Say Yes to Mental Health!

Cajole (v): To continually push to do something

Sob (v): Cry noisily

Symptoms of inattention

1 Making careless mistakes, overlooking details

Difficulty remaining focused on tasks and conversations

2

3 Being easily distractible

Difficulty following instructions.

4

Symptoms of hyperactivity and impulsivity

These symptoms were present in her for more than 6 months.

1 Frequent fighting

Often leaving seat when remaining seated is expected

2

4 Talking excessively

Impulsive blurting out

5

3 Difficulty waiting for a turn

6

Intruding or interrupting others

Evolution of the English Language

All this talk about evolution must have surely got you wondering about the evolution of language, specifically the one you're reading in: English. The English language may not be the oldest language in the world but it is the third most widely spoken after Chinese and Spanish. The language dates back to the 5th century but the one we speak today developed around the 15th century. But, since then it has evolved a lot, meanings of words have changed, some words have been discarded and many new ones have been added.

For instance "girl" once meant a child or a young person of either gender and "unique" just meant one of a kind rather than something unusual. Try out this exercise. Here are some common words whose meaning were NOT what they are today.

ACTIVITY 1 Try to match the words with their old and the current meanings.

SET A - WORDS

1. Nice
2. Silly
3. Awful
4. Fizzle
5. Naughty
6. Meat

SET C- CURRENT MEANINGS

- I. Pleasant
- II. End or fail in a disappointing way
- III. Badly behaved
- IV. Flesh
- V. Bad or unpleasant
- VI. Foolish

SET B - OLD MEANINGS

- A. Solid food of a variety of kinds
- B. Flatulence
- C. You have naught or nothing
- D. Things worthy of being blessed; weak and vulnerable
- E. Worthy of awe
- F. Silly, foolish, simple

Now, let's go to the etymology of words. Etymology is the study or origin of words and the way their meanings have changed over time. Many of the words are formed by adding prefixes or suffixes to make a completely new word. These are called root words. Example: Vid or Vis means "see" and the words that can be made out of them are vision, visible, visual - all of them relate to the meaning in some way or the other.

ACTIVITY 2 Here is a table with the root words, their meanings and some of the words created using them. Some cells have been left blank for you to fill up.

IF IDIOMS WERE LITERAL ...

ROOT	MEANING	WORDS
biblio	book	
DIC	Speak, -----	Dictate, predict, -----, -----
Ag, act	Do, act, drive	
Am, ami		Amorous, -----
min	Less, little, small	
sens, sent	Feel, sense	
it	go	Transit, -----, -----
pathy	Suffering, feeling	

Helping Syria Achieve Peace

"We're just living on the edge of life. We're always nervous, we're always afraid," said mother-of-nine Mariam Akash, whose husband was killed by a sniper in Syria. There has been some rapid publishing of various social media posts and broadcasting news sharing the agony* and devastation* of people from Syria. A few of them are crying out for help while the others have totally lost hope. In four-and-a-half years, more than 250,000 Syrians lost their lives. It began with anti-government protests that gradually resulted in a civil war.

An uprising that went bad

In the year 2011, the civilians of Syria experienced unjust in terms of democracy and government rules made by President Bashar al-Assad. It eventually triggered the entire nation and converted into a war "for and against Assad". According to United Nations, by June 2013, 90,000 people were killed in the war. Now the figure is 2,50,000 and counting.

Protesting civilians of Syria

Crises and cries everywhere.

More than 4.5 million people have fled from Syria to the neighbouring countries of Lebanon, Jordan and Turkey. A population of more than 1.2 million were driven from their homes in 2015 alone.

With 6 million children needing support from people across the world, about 70% of the population has no access to adequate drinking water and basic food. More than 2 million children are out of school, and four out of five are living in poverty.

It's peacetime: Building international relations

Various countries across the world have been in talks with the President to put an end to this while the rebellions have evolved significantly. Russia and USA have also interfered in understanding and putting forward the solutions that can bring peace to the nation. They have secretly agreed to make peace agreements and turning down terrorism. Backing this up by Afghanistan, Iraq, Yemen and Mexico's support, Syria is strongly supported by the world. Canada's Prime Minister, Justin Trudeau opened refugee homes for more than 2,50,000 Syrians who face different sort of crises and harassments in the war.

Justin trudeau with refugees

Where does the United Nations Organisation fit in all this?

UNO has been trying to cool the fire lit amongst the civilians since 2011 and found that political unrest is the reason for all this. The UN Security Council established Joint Investigative Mechanism for prohibition of Chemical Weapons (OPCW) in Syrian war. It would identify individuals, entities, groups or governments' illegal and criminal activities, if organised, sponsored or otherwise involved the use of chemicals as weapons in the country.

How difficult it will be if the same situation of Syria spreads to your country too! Maintaining good relations with other countries across the world is always integral to maintain World Peace. Conduct a mock Model UN with your class, each one representing a country, trying to resolve such a situation in your country, based on your I.R policies. Send us an account of it on imagine.thinkedu@gmail.com and get featured.

These are some of the cluster bombs that fell from the rockets launched by Bashar al-Assad and Putin on children and civilians inside the besieged East Gouta, as well as the use of most weapons, including napalm, explosive barrels and many more.
#7WordsForSyria

A 15 year old journalist, Muhammad Najem who posts videos of war appealing to the world "not kill their childhood."

Agony (n): extreme physical or mental suffering
Devastation (n): great destruction or damage.

Backing up Butterflies

Did you know that the fluttering feeling you get in your stomach when you're anxious is expressed as the idiom - "butterflies in the stomach"? While that's just a feeling, real butterflies and moths have been around for more than 130 million years now!

Butterfly Scientific Name: Rhopalocera
Moth Scientific name: Gynnidomorpha Alisman

The life cycle of a butterfly is a miraculous metamorphosis, that is, transformation of an egg to an adult in insects and amphibians.

Taxonomy (Classification)

Kingdom	Animalia	Animals
Phylum	Arthropoda	Joint-limbed invertebrates
Class	Insecta	Insects
Order	Lepidoptera	Includes all butterflies and moths

It begins from an egg to get there to fly:

The life of a butterfly starts from an egg. The females lay eggs which tragically, are found tasty by the caterpillars. Fighting through odds, some larvae (caterpillars) comes out of the eggs. All they do is eat, eat and eat! The caterpillar sheds its skin to enter into the next stage where it forms a cocoon around it called Pupa. No matter where the pupating happens, after a chemical reaction, a butterfly comes out of it. This entire cycle takes about a month.

What's it like to be a butterfly?

You've got enemies everywhere if you're a butterfly. Frogs from ponds, lizards and spiders from anywhere, wait to munch on you. Birds and bats swoop down on you from the sky. Woah! However, butterflies have clever ways to escape them.

But butterflies are immensely endangered by humans and pollution. Some of them are:

Class 8, EVS, Chapter-20

The Karner blue (*Plebejus melissa samuelis*)
Found in Indiana Dunes National Park.

Palos Verdes blue (*Glaucopsyche lygdamus palosverdesensis*)
Found in Palos Verdes Peninsula in California, United States. The threat is habitat destruction due to weeds and rototilling. Conservation increased the population by from 200 to 4,00

Emperor of India butterfly aka - Kaiser-i-hind (*Teinopalpus imperialis*)

Red List Status: Near Threatened
Found along the Eastern Himalayas, India

IMAGINE TRIVIA:

- Butterflies have no mouths and taste with their feet

- They cannot fly without sun at all
- Their skeleton is outside their body

1. The painted lady is the longest continuously migrating butterfly ever recorded and can fly 2500 miles at a time!

3. Scientists have named a new species of butterfly as "Wahydra graslieae" after Emily Graslie, the writer, producer and host of the YouTube channel The Brain Scoop. It's a postage stamp-sized, dark rust-colored butterfly.

2. A new species of Himalayan moth (*Eucyclodes gavissima*) has been discovered in Papikonda National Park.

P.J Cherian: Imagine's Indiana Jones

YOU IN FUTURE

In this section of Imagine, we keep introducing you to various career options for your future and what you can do to work towards them. Today, however, we've brought to you an Indiana Jones in real life: the archaeology professor P.J Cherian. Let's dig up his career and see what we can find that will help our inner archaeologist come out.

Full name: P.J Cherian
Designation: Professor
Company/Institution: PAMA Institute for the Advancement of Trans-disciplinary Archaeological Sciences
Qualification: Ph.D
City: Thiruvananthapuram
State: Kerala
Nationality: Indian

Can you introduce archeology to our young readers?

Archaeology is science based enquiry into the ancient or prehistoric past of humanity. It means lot many things. Primarily, it is the extraction, analysis and observation of material evidence from subterranean* or underwaters to study human past. It also involves the reconstruction of the lost or hidden past and corroborating with textual sources.

What does work look like for an archaeologist like you?

Archaeologists search for past human life. Today, the aspiration is to reconstruct the day today life of our ancestors. For that we have to do multiple things from Surface Surveys (explorations) locating Archaeological sites, excavations (digging up), laboratory analysis and research

There are so many career choices out there. Why should one choose archeology? How's it different?

Archeology career is science centric. It gives lot of opportunities to humanity and nature and the relationship between the two. Archaeology can change or transform us. It might help us reimagine a more positive present and future.

What are the jobs available for the Archeologists?

Numerous opportunities are open to Archaeology researchers. Working in institutes and universities is one possibility. The others include, recreating endeavors that is important for change in social and individual life. Art and architecture are today considered sister disciplines of Archaeology because it also gives primacy* to material.

What can be done by the students in school right now to be a future archaeologist?

Be infinitely curious. Be precise in the search for your own cultural roots. Do extensive reading, visit excavation sites, participate in explorations, do internships during vacation time on themes of your Archaeology interests.

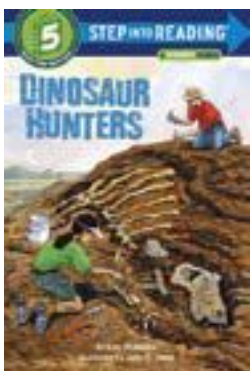

What was your area of study before a major in Archaeology?

History. But in hindsight* I feel science disciplines could equally have been supportive to grow into a good Archaeologist.

How/what was your journey as an Archeologist?

Archaeology was always my childhood dream. But with no courses available in Kerala then and little opportunities for exposure in Archaeology, I studied history. When the first opportunity came I devoted my attention to Archaeology. I started a part-time course to learn and teach Archaeology. I could enrich the little museum of my college into a beautiful thinking place with more and more artefacts. I also realised that learning beyond classrooms is crucial. My students and colleagues really made archeology learning a sort of celebration. Lastly, my Archaeological journey made me realize that it is a team effort than an individual adventure.

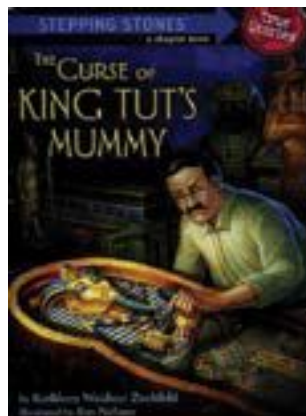

If you're interested in archaeology, paleontology and anthropology, here are a few great reads to help you get started.

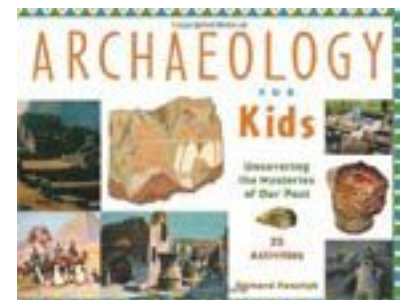

Dinosaur Hunters
(Step into Reading)

DK Eyewitness Books:
Ancient Egypt

The Curse of King Tut's Mummy
(Totally True Adventures)

Series: Archaeology for Kids

Subterranean (adj): occurring under the earth's surface
Primacy (n): the fact of being pre-eminent or most important
Hindsight (n): understanding of a situation or event only after it has happened

In a time when the flora and fauna in the wild are becoming more and more endangered, there are initiatives taken by, scientists and passionate animal lovers to conserve as much as they can in the form of man-made forest for wildlife - National Parks. And as school's up, surely your family and you are planning out your adventures in the holidays. For those of you who've been cooped up all year round, here are two great National Parks for a perfect family getaway.

JIM CORBETT NATIONAL PARK

Situated in Nainital, Uttarakhand, Jim Corbett National Park, named after legendary tiger hunter turned naturalist Jim Corbett was primarily established to preserve tigers. It was formerly known as Hailey National Park (estd. In 1936) and is the oldest in the country.

What's so special?

- 75% of the park is covered by Sal forests.
- Home to 50 mammals, 577 birds and 25 reptiles.
- Conservation Projects: Project Tiger, Crocodile Conservation Project, Project Elephant.
- Divided into 5 different zones with different topography and visiting period

Activities

Watch wildlife in Safari on Elephant backs, jeeps and canters. Go for adventure activities like angling, river crossing, mountain climbing, rappelling, trekking and jungle drive.

Other places to visit

Garjiya Devi Temple, Sitabani Forest Reserve, Sitabani Temple, Corbett Museum, Dhangari Museum, Corbett Water Fall, Sunrise Point.

Stay

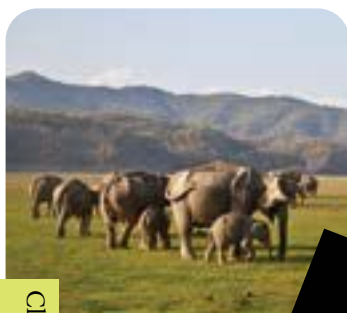

Although there are multiple hotels and resorts to choose from, we recommend you to go for camping or camping in a resort, preferably by the river to make the most of this trip. There are government sponsored packages that will give you the thrill of staying in the jungle.

Travel

- ✈ Pantnagar (Domestic), New Delhi (International)
- 🚂 Ramnagar railway station
- 🚗 Dhumakot, Kotdwara.

Best time to visit

January to April & November to December

Class 8, EVS, Chapter-17

GALAPAGOS NATIONAL PARK, ECUADOR

Created in the year 1959, it is the first National Park in the country of Ecuador. It's a collection of rocky, volcanic lands and is best known as the inspiration for Charles Darwin's research on the theory of Natural Selection and Evolution. About 95% of the islands are part of the Galapagos National Park system.

What sets it apart?

- Galapagos have been declared as a World Heritage Site by UNESCO
- More than 1,900 of the 5,000 species found are endemic*
- Protects an additional 53,000 square miles of ocean around the islands
- Incorporated Sustainable Tourism
- Giant tortoise breeding centers, big sea lion colony and Galapagos penguins

Best time to visit

June to August and mid-December to mid-January

Travel

Most visitors will travel to Galapagos by air from mainland Ecuador, Baltra Island & San Cristóbal. There are different tourist packages that can take you from one island to another in cruises.

Stay

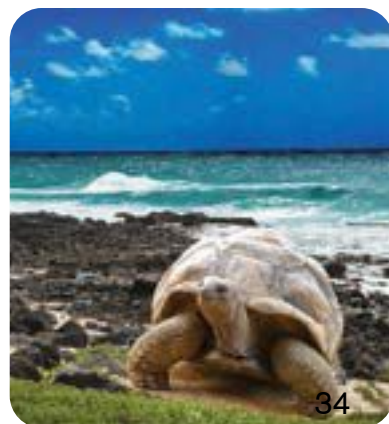

There are a number of hotels and resorts situated in the island that serve to the best of their amenities to the tourists.

Activities

Apart from safari in the jungle it's famous for diving, snorkeling, hiking, kayaking and surfing.

HOLIDAY BACKPACK CHECKLIST

- Quick-dry clothing
- Waterproof camera or dry bag for electronics
- Swimsuit
- Sun hat, sunscreen, sunglasses
- Refillable water bottle to reduce plastic waste.
- Motion sickness medication for boat tours.
- Nutrition bars

MARTIAL ARTS

Rise of Mixed Martial Arts and Catch Wrestling

Powered by Kapap Academy, Singapore

Martial Arts, as systems of codified combat techniques are often practiced for a number of reasons: namely, for self-defense, military or law enforcement applications, mental and spiritual development, as well as for entertainment. While there is much controversy and debate on when and where 'martial arts' as a fighting system first appeared in human history, few doubt that man has been fighting one another since organised human societies first surfaced.

In modern times, there has been a revival of interest in the practice of martial arts as sports entertainment and for self-defense. The first is partly due to the advent of social media technology (e.g. Youtube, Facebook, etc) that allow organized sport fights to be transmitted and shared easily. The upsurge of interest in learning martial arts for self-defense is however due to the global social climate where hate crimes, human trafficking and sexual violence against women and children are on the rise.

An interesting development within the sporting arena of martial arts is the recent rise of Mixed Martial Arts (MMA). Evolved from the era of Kickboxing (1960s to 80s), MMA is a full contact combat sport that allows fighters to engage in both stand up striking and kicking, as well as ground grappling. Making its official debut in the early 1990s, MMA is arguably the world's fastest growing sports today.

The rise of MMA has also contributed to the rejuvenation of an ancient art known as Catch Wrestling. It is a hybrid grappling style that is derived from a number of other styles such as English wrestling, American 'Rough and Tumble', Greco-Roman wrestling, Iranian wrestling and the Indian Pehlwani style of wrestling.

MMA and Catch Wrestling are both combat sports that requires practitioners to develop a strong sense of discipline, mental resilience and the courage to face and conquer one's fears. While most sports would nurture discipline and mental resilience, the combative nature of MMA and Catch Wrestling makes greater demands on one's ability to face and conquer one's fears. Such positive mindsets developed are beneficial to any individual both in the sporting and non-sporting contexts of life. Thanks to the improving and tighter regulations surrounding amateur competitions, MMA and Catch Wrestling is set to take the stage of combative sports in the world, with Asia as an important source of future sports combatants.

About Kapap Academy:

Kapap Academy (Singapore) is one of the top realistic self-defense/combat training schools in Singapore, having trained over 90 schools and 140 companies (e.g. multinationals, governmental bodies etc). In 2014, Yahoo! Sports independently voted it as one of the top 5 martial arts schools in Singapore. In 2017, the CEO of Kapap Academy, Ms Qin Yunquan, became the first and only martial artist in the world to have ever been awarded the Queen's Young Leader's Award – for her social outreach work saving lives through empowerment self-defense. In the same year, Ms Qin was given a Citation Award under the Singaporean of the Year Award. Kapap Academy in collaboration with the Catch Wrestling Alliance (US), organized the first Catch Wrestling Competition in South East Asia. The school remains the primary training centre in Asia for Catch Wrestling. Other combative sports training, the school provides include Muay Thai, MMA etc.

The Ingenious Journey of Imagine

Walking past three academic years, Imagine has successfully published 3 volumes. Our journey of impacting and influencing students, instilling a passion for learning and creating an aid to teachers and parents, was an energetic and instructive experience. With the mission of bridging the gap between academic learning and the real world, Imagine Magbook today stands tall with multiple memories and achievements.

THE COLLABORATION WITH MATRUSRI GROUP OF SCHOOLS

Imagine's goal of reaching out to schools and students across India for the betterment of the education system was reinforced with the much awaited *collaboration with Mr.Aravind Kapatkar, the founder of Matrusri Group of Schools, one of the largest educational conglomerate in India* that provides quality and affordable education to students. Today, Imagine is a part of this prestigious movement with a *readership of more than 80,000.*

FILLING THE BLANK SPACES WITH THE BLANK PAPER COMPETITIONS

Tapping the creativity and the unconventional use of expression through art and literature, Imagine successfully conducted 15 Blank Paper Competitions in the last academic year in Hyderabad's schools such as Gitanjali Devashray, Niraj Public School, and P.Obul Reddy Public School.

Gitanjali Devashray

Niraj Public School

P Obul Reddy Public School

ASSOCIATION WITH STAEDTLER AND AINDRIYA

Imagine saw a very fruitful liaison with two premium stationery companies-Staedtler (Alpha International) and Aindriya sponsoring prizes for the Blank Paper Competition.

Launch of the Imagine App- The newly launched Imagine app aims to disseminate world news and the latest news in K-12 sector in less than 60 words. The app provides student journalists, educators, academicians and schools with direct access and the power to publish their content instantly to their audience and minimizes the time between publishing and audience reception.

CONTRIBUTORS AND INTERVIEWS

Imagine has created its very own network supporting its vision and mission. We interviewed more than 15 child prodigies and 10 academicians over a span of 5 months and had nearly 50 content contributors and organisational collaborations.

Founder of Matrusri

Imagine, Inspire and Incline.

Spreading the joy of imagination @ the Hyderabad Kids Fair 2018

Imagine Magbook's stall at Hyderabad Kids Fair 2018 was a blockbuster with a foot fall of 40,000. We formed a strong network of readers, collaborators, and contributors who appreciated and came forward to be a part of our ideas and motives.

Summer Camps Around You!

Saptaparni Summer Camp

Age Group: 3-15 years

Venue: Saptaparni, Banjara Hills road 8, Hyderabad

Dates: April 16 to May 12

Phone: 9000581919

Email: vandanabadruka@gmail.com

Cognosia Summer Cognition Camp

Age Group: 9 to 15

Venue: 302, Ivy Terrace, Road No 44, Kavuri Hills, Hyderabad

Dates: April 15 to May 5

Phone: 9885303289, 040-40188220

Email: help@cognosia.com

Inspire Summer Camp

Age Group: 4 years onwards

Venue: Inspire Summer Camp, Himayath-nagar, Hyderabad

Dates: April 15 to June 1

Phone: 8977772524

Email: inspirepainting@gmail.com

Rangmanch Summer Camp

Venue: Above Swagath grand hotel, himayath nagar main road, Hyderabad

Start date: April 16 to May 26

Phone: 070322 55181

Email: ajrangmanch@gmail.com

Gandhi Gyan Mandir Yoga Kendra

Venue: King koti opp to gokul chat near Women's College

Start date: May 5

Phone: 040 6673 5331

B Sporty Summer Camp

Venue: Meridian School Road, Siddhi Vinayak Nagar, Madhapur, Hyderabad.

Start date: April 15

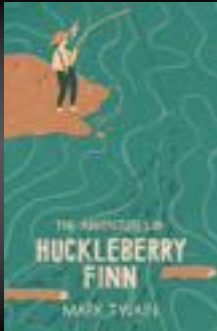

Phone: 9000414422, 9866602615

Email: marketing@bsporty.org

The Adventures of Huckleberry Finn

Mark Twain, 1884

The story is narrated by Huckleberry Finn, a young boy in the 1840's who runs away from home and floats down the Mississippi river. He meets a boy named Jim who is a slave who runs away from his master. They both undertake a series of adventures and challenges and come across numerous obstacles. Along the way, Huck and Jim meet the King and the Duke. They ultimately send them towards a different route. In this entire journey Huck begins to differentiate between the right and wrong and in the end, he is faced with the dilemma between the world's prejudice*, which he has grown up with, and the lessons Jim taught him in the journey about the evils of racism.

Ice Age series

The movie series is an interesting and a thrilling adventure by the animals, Sid the sloth, and Diego the saber-toothed cat. They go into an adventure to return a baby of human tribe. But Diego is sent secretly by Soto, the antagonist to bring the baby and mammoth and kill them. The story continues with various twists and sequels. In Ice Age: The Meltdown, global warming affects the environment and water threatens to flood the valley. They have to go to the other side of the valley, where there is a giant tree that can act as a boat to save them. In Ice Age: Dawn of the Dinosaurs, Manfred and his mate Ellie await their first baby while Diego decides to leave the herd. Meanwhile, Sid grows jealous of Manny and Ellie and adopts three apparently abandoned eggs that hatch into dinosaurs. In Ice Age: Continental Drift, Sid reunites with his old family. Manny, Sid, his granny, and Diego all meet and battle until Manny gets home. And finally Ice Age: Collision Course, Scratt, the squirrel accidentally creates the known solar system, with an alien space ship that had been frozen in a glacier. But incidentally an asteroid comes, where the group becomes singularly focused on survival and team up with their clever weasel friend, Buck and find their way out.

Prejudice (n): Already formed opinion that is not based on reason or experience

Primate (n): Order similar to monkeys and apes

Ever Evolving Entertainment

Evolution is not something that is limited to earth but a principle that can be applied throughout the universe. It is a subject that has been the muse and theme of several books and even more movies. We bring to you some of the best from the lot for your summer time reading and watching.

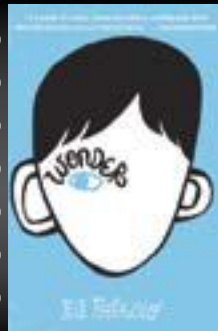

More Summer Reads

- The World's Worst Children by David Williams
- I Am Enough by Grace Gealey
- How to Grow a Dinosaur by Jill Esbaum
- Early Man: The Junior Novelization by Aardman Animation Ltd
- Artemis fowl by Eoin Colfer

Wonder

(R.J Palacio, 2012)

Wonder is an incredibly inspiring and uplifting story about a boy named August Pullman who is born with a special face. He had never attended school due his facial difference until he decided to join the 5th grade at Beecher Prep School. He wants nothing but to be treated as an ordinary, normal kid. But his classmates can't get normal with Auggie's face. Some are shocked, some saddened while some bullied him. The book is mostly from Auggie's point of view but it changes to include his classmates, his sister, and others. The book was turned into a film in 2017 by the same name. It combined into a view of special children's struggle with acceptance.

*Good ideas go hand-in-hand

Charles Darwin said, "It's not the strongest of the species nor the most intelligent that survives. It is the one that is the most adaptable to change." One of those limited things that actually have no limits is one's "imagination". It's the imagination that makes one understand, respond and adapt to the circumstances that are ever changing and challenging. You see a trillion ideas converting into actions, creating a revolution by impacting the world so there's an evolution for the better. Be the one who creates a history and makes a difference. Keep dreaming, discovering and imagining. For not even the sky is a limit to your imagination.
